THE 2011 ALABAMA PERFORMANCE COMPARISON OF SMALL GRAIN VARIETIES

K.M. Glass, E. van Santen, and K. Bowen

Advisor, Natl. Res. Prog. and Professor, Dept. of Agronomy and Soils and Professor, Dept. of Entomology and Plant Pathology, Auburn University, AL 36849.

INTRODUCTION

The large number of commercially available varieties of wheat, oat, barley, and triticale makes it difficult for growers to select varieties most suited for their particular area of the State. Making this decision requires up-to-date, unbiased, reliable information on varietal yields and characteristics. This report is published annually to provide Alabama growers with this information.

Entries in each experiment are determined by the companies or institutes which control each variety or line, not by experiment station personnel. Data from tests conducted at eight locations were used to compile this report and they represent the varied growing conditions farmers experience around the State.

PROCEDURE

The experimental design for the tests was a split plot design with species as the main plot and varieties as subplots. Plots were 5 feet by 20 feet with rows spaced 7 inches apart. A cone drill was used to plant all tests in the State. Each variety was replicated three times in each test.

Grain only: These tests are normally planted during late October to early November, which is approximately one month later than the forage tests. Planting dates for all tests in 2010 are shown in Table 1. All tests were fertilized with P and K according to soil test, plus 20 pounds N per acre at planting. A top dressing of 60 pounds N per acre was made in late February or early March, just prior to jointing. The plots were not sprayed to control disease, so that the varieties could be rated for their inherent disease resistance. The grain was allowed to mature and was harvested with a plot combine, then cleaned and weighed. Moisture and bushel test weight were measured.

Forage only: A forage test was not conducted during the 2010-2011 crop year.

DATA EXPLANATION

Grain yields were calculated by weighing air-dried grain and using 60 pounds per bushel for wheat, 32 pounds per bushel for oat, 48 pounds per bushel for barley, 50 pounds per bushel for triticale. Lodging was measured as the percent of plants in the stand broken or leaning that would likely be missed by a combine. Height was measured from the ground to the top of the grain head. The 1/10 headed date is the date when approximately 10 percent of a plot showed fully emerged heads.

Disease ratings for the 2010-2011 variety trials for wheat, oats, barley and a variety of rye, are summarized by region on pages 25-28. Diseases were rated by members of the Dept. of Entomology and Plant Pathology; Specifically, H. Lee Campbell, Research Associate, rated diseases at southern sites (Gulf Coast and Wiregrass), and in the central (PBU and Prattville) and northern (Tennessee Valley and Sand Mountain) regions, diseases were rated by Dr. K. L. Bowen, Professor, and A. Subedi, Graduate Research Assistant. Rust diseases are rated on a severity scale ranging from 0 to 100 and indicating the proportion of the flag leaves that are affected across the plot. All other diseases are rated on a scale of 0 to 9, where 0 indicates no disease, 4-5 reflects about half of the plants are moderately affected, and 9 indicates severe disease affecting all plants in plot. A "T" indicates that a trace of the disease was noted.

DISCUSSION

Growing conditions and variety performance often vary among locations and years. Growing season conditions in the 2010-11 were good for small grain production at almost all locations. The exception was the Tennessee Valley Research and Extension Center which was hit by a tornado resulting in severe lodging in all plots and a delayed harvest.

In general, disease pressure throughout the state was minimal in the spring of 2011. Leaf rust and stripe rust was observed on wheat throughout the state; onset of both of these rusts was relatively late in the season. Leaf rust developed to levels similar to that seen in 2010. Stripe rust, which was seen at low levels in the Wiregrass area in 2010, was observed at Tennessee Valley in 2011. Septoria leaf and glume blotch remained low and was slightly lower than seen in the preceding year. Fusarium head blight (= scab) was noted at northern locations, as well as in Tallasee on wheat. Scab intensity was about equal to that seen in 2010. Minimal disease developed on any oat varieties; low to moderate levels of Helminthosporium leaf spot was noted throughout the state. Crown rust was observed on oats in Tallasee. On barley, scald was observed at moderately low levels. Barley yellow dwarf, which affects most small grain species, was minimal across the state.

TABLE 1. LOCATION, PLANTING AND HARVESTING DATES FOR THE 2010-11 SMALL GRAIN TESTS.

Location	Date planted	Date harvested

¹ Disease rated on a scale of 0 to 9 where 0 = no disease, 9 = severe disease throughout plot.

TABLE 20. LEVELS OF DISEASES ON OAT VARIETIES AVERAGED ACROSS TWO SITES PER REGION (SEE WHEAT TABLES FOR SITES), 2010-2011.

Brand-variety	North Alabama			Central Alabama		South Alabama	
	Leaf spot ¹	Barley Yellow Dwarf ¹	Crown Rust ²	Leaf spot ¹	Crown Rust ²	Leaf spot ¹	Barley Yellow Dwarf ²
Florida 501	2	0.3	0	1	.	1.3	6.7
FL 0522-92-S1	0.3	0	0	0	2	1.2	0
LA 03063-S4	2	0.3	0	1	3.5	3.7	1
LA 05006-65-S1	0.7	0.3	0	0.5	2.5	1.7	1.3
Soil Saver	T	0	0	0	2	0.8	0
L111-9-MXD	0.3	0.3	T
NOATS-2	1	0.3	0

¹ Disease rated on a scale of 0 to 9 where 0 = no disease, 9 = severe disease throughout plot.

² Rust diseases are rated on the flag leaves as a proportion of affected leaf, 0 to 100%.
