color, sex, or national origin.*

Acknowledgments

Appreciation is expressed to Mien-Huei Tzeng, Research Data Analysis, for the computation and summarization of data in this report.

Appreciation is also expressed to the following supervisory personnel of the outlying units whose support is gratefully acknowledged:

Northern Alabama

Tennessee Valley Substation, Belle Mina	B.E. Norris, Jr., Supt. H.E. Burgess, Assoc. Supt.
Sand Mountain Substation, Crossville	R.A. Dawkins, Supt. M.E. Ruf, Asst. Supt.
Upper Coastal Plain Substation, Winfield	R.C. Rawls, Supt.

Central Alabama

Black Belt Substation, Marion Junction	J.L. Holliman, Supt.
Prattville Experiment Field	D.P. Moore, Supt.
E.V. Smith Research Center	J. S. Bannon, Dir.
Plant Breeding Unit, Tallassee	S.P. Nightengale, Supt.

Southern Alabama

Monroeville Experiment Field	J.R. Akridge, Supt.
Gulf Coast Substation, Fairhope	N.R. McDaniel, Supt. M.D. Pegues, Asst. Supt.
Lower Coastal Plain Substation, Camden	J.A. Little, Supt. P.A. Rose, Asst. Supt.
Wiregrass Substation, Headland	L.W. Wells, Supt. B.E. Gamble, Asst. Supt.

The 1998 Alabama Performance Comparison of Small Grain Varieties

K. M. Glass and P. L. Mask¹

INTRODUCTION

The large number of commercially available varieties of wheat, oat, rye, barley, and triticale makes it difficult for growers to select varieties most suited for forage production in their particular area of Alabama. Making this decision requires up-to-date, unbiased, reliable information on varietal yields and characteristics. This report is published annually to provide Alabama growers with this information.

Entries in each experiment are determined by the companies or institutes which control each variety, or line, not by experiment station personnel. Data from tests conducted at nine locations were used to compile this report. These locations represent the varied growing conditions farmers have around Alabama.

PROCEDURE

The experimental design for the tests was a split plot design with species as the main plot and varieties as subplots. Plots were 5 feet by 20 feet with rows spaced 7 inches apart. A cone drill was used to plant all tests in the State. Each variety was replicated three times in each test.

The trials were divided into two management systems: grain only and forage only.

Grain only: These tests are normally planted during late October to early November, which is approximately one month later than the forage tests. Planting dates for all tests in 1997 are shown in table 1. All tests were fertilized with P and K according to soil test plus 20 pounds N per acre at planting with a top dressing of 60 pounds N per acre in late February or early March, just before jointing. The plots were not sprayed to control disease so that the varieties could be rated for their inherent disease resistance. The grain was allowed to mature and was harvested with a plot combine. The grain was cleaned and weighed. Moisture and bushel test weight were measured.

Forage only: These tests are normally planted in late September to early October. Tests were fertilized at planting with 100 pounds N per acre and clipped with a flail-type mower each time they reached six inches in height. A sample was weighed green from each plot, then dried and reweighed. The percent dry matter figure from these weights was used to calculate dry forage matter per acre. The test was top dressed in February with 60 pounds N per acre and clipping was continued until no regrowth occurred.

DATA EXPLANATION

Grain yields were calculated by weighing air-dried grain and using 60 pounds per bushel for wheat, 32 pounds per bushel for oat, 48 pounds per bushel for barley, and 50 pounds per bushel for triticale.

Lodging was measured as the percent of plants in the stand broken or leaning that would likely be missed by a combine. Height was measured from the ground to top of the grain head.

The 1/10 headed date is the date when approximately 10 percent of a plot showed fully emerged heads.

Disease ratings for all 1997-98 variety trials are summarized by region in tables 14 through 20. Katherine Burch, Research Associate, Plant Pathology, made disease ratings at all locations. At the time of mid-season ratings, disease incidence and severity were generally lower across the state than in 1997. On wheat, incidence of leaf rust and powdery mildew and the viral disease barley yellow dwarf was lower throughout the state, while levels of Septoria

¹Glass is an Agricultural Program Associate and Mask is an Associate Professor in the Auburn University Department of Agronomy and Soils.

leaf blotch remained mostly unchanged from the previous year. On oat, levels of *Helminthosporium* leaf spot were higher in northern and central Alabama and unchanged from last year in the southern region. Barley yellow dwarf was observed to be lower throughout the state, while incidence of crown rust was higher. Stem rust on oat was present on most varieties at the Gulf Coast and Wiregrass Substations. On triticale, low levels of leaf rust and *Septoria* blotch were observed on entries at most locations while incidence of barley yellow dwarf was much lower compared to 1997. On barley, spot blotch and *Septoria* blotch developed at low to moderate levels on the entries at all locations. Leaf rust of barley was observed at moderate to high levels in all entries at the Upper Coastal Plain Substation.

DISCUSSION

Growing conditions and variety performance often vary among locations and years. Regional averages and multiple-year averages are given here to use as a better indicator for performance comparison. The 1995-96 growing season was much colder than normal which severely reduced yields on some varieties at all locations. Oat varieties were especially affected and several varieties were winter killed. In the 1996-97 growing season, all locations had wet conditions, causing delayed harvest at some locations and possibly reducing yields in some varieties. Both lodging and bird damage was moderate to severe in oats at most central and southern locations. The 1997-98 growing season was a mild, wet fall and winter with a dry spring. Both the forage- and grain-only trials were not planted at the Black Belt Substation, Marion Junction, due to dry then wet conditions during planting season. There was herbicide injury on the grain-only trial at Upper Coastal Plain Substation, Winfield. It was determined that the trial data were invalid and therefore not reported. Neither Marion Junction nor Winfield were included in the two- and three-year averages for their regions.

TABLE 1. LOCATION, PLANTING, AND HARVEST DATES FOR 1997-98 SMALL GRAIN TESTS

Location	Date planted	Date harvested
Northern Alabama		
Tennessee Valley Substation (Belle Mina)		
Small grain forage only	October 21	
Small grain grain only	November 20	June 17
Sand Mountain Substation (Crossville)		
Small grain forage only	October 23	
Small grain grain only	November 5	June 11
Upper Coastal Plain Substation (Winfield)		
Small grain forage only	October 16	
Small grain grain only	October 16	June 16
Central Alabama		
Black Belt Substation (Marion Junction)		
Small grain forage only	Not planted	
Small grain grain only	Not planted	Not harvested
E.V. Smith Res. Ctr., Plant Breeding Unit (Tallasse)		
Small grain forage only	October 8	
Small grain grain only	November 19	May 26
Prattville Experiment Field (Prattville)		
Small grain forage only	October 16	
Small grain grain only	November 18	May 28
Southern Alabama		
Gulf Coast Substation (Fairhope)		
Small grain forage only	October 23	
Small grain grain only	October 23	May 15
Monroeville Experiment Field (Monroeville)		
Small grain forage only	November 11	
Small grain grain only	November 11	May 28
Lower Coastal Plain Substation (Camden)		
Small grain forage only	November 10	
Small grain grain only	November 10	May 21
Wiregrass Substation (Headland)		
Small grain forage only	October 20	
Small grain grain only	November 20	May 21

Pioneer 2580	fair	good	good	good	fair	late	fair	long
Pioneer 2643	good	good	good	poor	good	late	good	long
Pioneer 2684	poor	good	good	good	good	early	fair	medium
Pioneer 2691	fair	fair	fair	fair	fair	early	good	very short
Roberts	poor	good	good	good	good	late	fair	med. long
Wakefield	fair	fair	fair	poor	good	late	fair	long

CHARACTERISTICS OF SELECTED OAT VARIETIES

Brand-Variety	Crown rust resistance	Cold hardiness	Maturity	Test weight	Straw strength
AgriPro Hickory	fair	fair	medium	fair	medium
AgriPro Mason	poor	good	early	good	short
Citation	poor	good	medium	good	good
Florida 501	poor	poor	early	good	poor
Florida 502	fair	poor	early	good	good
GA-Mitchell	poor	fair	medium	fair	good
NK Coker 716	poor	good	medium	good	good
Ozark	poor	good	med-late	fair	poor
Simpson	poor	good	medium	good	fair

Barley Yellow Dwarf

Although Barley Yellow Dwarf is a significant problem in Alabama, no current oat or wheat varieties have adequate resistance to this disease. All oat and wheat varieties are susceptible.

Hessian Fly

In the 1996-97 and 1997-98 growing seasons biotype 'L' of hessian fly was found in Alabama. This biotype represented only a small portion of the population. The level of resistance to hessian fly as shown in the table is only valid for the biotypes other than 'L' since none of the current commercial varieties are resistant to this new biotype.
