*"The mission of the Alabama Variety Testing Program is to provide research-based, unbiased results on the performance of various crop hybrids, cultivars, and varieties to the agricultural community in our state. We are intent on conducting these trials in a manner that will result in maximum biological yield through methods common to the top-producing farms in Alabama. We are committed to providing this information in a rapid, timely manner for its use during the decision-making process. The success of the program rests upon our ability to help Alabama producers provide a safe, dependable source of food and fiber for all families as well as economic sustainability for theirs."*

Field corn hybrids are evaluated in 2014 by the Alabama Agricultural Experiment Station as a service to producers, crop advisors, and industry. Field trials on corn hybrid performance were conducted on experiment stations throughout the state to evaluate yield performance under different climatic factors and soil types. Non-irrigated, conventional tillage trials were conducted at two locations in the northern region, two locations in the central region, and three locations in the southern region. The non-irrigated location at E.V. Smith Field Crops Unit in central Alabama was "no-till". In addition, an irrigated, conventional tillage corn hybrid test was conducted in the northern region at Belle Mina (TVREC).

### **Methods**

Field trials at all locations were conducted with hybrids arranged in a "randomized complete block design" with four replications. Plots were 2, 30- or 36-inch wide rows that were 20 to 30 feet long, according to the location. Planting rate was 28,000 or 32,000 seeds/acre. The entire plot was machine-harvested for yield and grain moisture content recorded. Grain yields were adjusted to 15.5% moisture and converted to yield (bushels/acre). Due to equipment breakdown and inclement weather, the trial at E.V. Smith Field Crops Unit is not presented in this report.

## Acknowledgements

We would like to express our appreciation for the work and dedication of the supervisory and staff personnel of the Alabama Experiment Station outlying units without whom this work would not be possible. Thanks are also expressed to the producers and citizens of Alabama for supporting research on the production of food and fiber across our state.
