Alabama Agricultural Experiment Station Auburn University
Lowell T. Frobish, Director Auburn University, Alabama
November 1992

1992 REGIONAL COTTON FUSARIUM WILT REPORT¹

Kathryn M. Glass²

Cotton cultivars and elite breeding lines submitted by 20 cooperators were evaluated for fusarium wilt resistance under field conditions at the E. V. Smith Research Center, Shorter, Alabama. These entries were grown on an Independence loamy fine sand highly infested with both the fusarium wilt fungus (Fusarium oxysporum) Schlect. f. vasinfectum [Atk.] (Snyd. & Hans.) and root-knot nematodes (Meloidogyne spp.).

Plots were 40-inch-wide bedded rows, 30 feet in length, separated by 6-foot alleys. Four replications of the test entries and checks, arranged in a block design, were evaluated. Both susceptible (Rowden) and resistant (Auburn 56) cultivars were included as checks. Auburn 56 was developed at Auburn and released in 1953. It was used as the resistant check in the Regional Fusarium Wilt Test for many years. However, it was replaced when it was no longer grown commercially. Auburn 56 is again being used as the resistant check because, although obsolete, it is the most consistently resistant cultivar available. Rowden was planted in row 5 and every tenth row thereafter (15,

¹This report is a joint contribution between USDA-ARS, Crop Science Research Laboratory, Mississippi State, Mississippi, and the Alabama Agricultural Experiment Station, Auburn University, Alabama.

²Research Assistant of Agronomy and Soils

25,...,225) and Auburn 56 in row 10 and every tenth row thereafter (20, 30,...,220) throughout the test. Plots were planted May 14. Initial plant counts were made on June 18. Wilted plants were counted and removed on July 15, August 3, August 17, and August 24. The remaining live plants were also counted and recorded on August 24. Percent wilted plants were then determined and mean wilting for a given entry calculated.

Average wilting of the susceptible Rowden was 69, 59, 56, and 68 percent for the four replications (63 percent average). Corresponding wilt percentages for the resistant check, Auburn 56, were 13, 14, 10, and 11 (12 percent average). Critical evaluation of a given entry should be made relative to the checks closest to the entry within each replication. Evaluation of breeding process or evaluation of entries over years should be made only between the relative value of this entry and that of the closest susceptible check rows for each year.

Entries submitted by W. C. Johnson are commonly grown cultivars or advanced commercial materials and are listed by name. Entries submitted by other cooperators are listed by their coded numbers. Additional information regarding the genetic background of a specific coded entry should be obtained from the named cooperator.

Information contained herein is available to all persons without regard to race, color, sex, or national origin

ACKNOWLEDGMENT

The author expresses appreciation to A.J. Kappelman, Jr., retired, for advice and technical assistance in conducting the test and preparing this report.
