1974 ALABAMA COTTON VARIETY REPORT^{1/}

A Report of the Performance of Cotton Varieties
Tested at Nine Locations in Alabama During 1974

Wiley C. Johnson^{2/}

The Alabama Cotton Variety Test is a continuing evaluation of available cotton varieties from both private companies and state experiment stations. Breeding lines that are likely to be released as varieties are also tested. All tests are conducted on units of the Agricultural Experiment Station by Experiment Station personnel. All phases of culture are as generally recommended by the Experiment Station to farmers. Every effort is made to test the varieties and present the data in an unbiased manner.

Experimental Design and Plot Size

A randomized block design in four replications was used at each of nine locations. Length of plots at different locations varied from 34 to 142 feet. All plots were single row.

Seasonal Conditions for the Tests

In general, weather conditions were marginal for successful establishment. The spring was cool and wet; however, it was necessary to replant skips only at the Tennessee Valley Substation, Belle Mina. Midseason conditions were good with frequent showers and no extended drouth periods. Late summer and fall were again cool and wet. At the Sand Mountain Substation, Crossville, the first freeze was early, occurring October 3. All northern locations had large numbers of near mature bolls killed by the first freeze.

^{1/}February 1975

^{2/}Professor, Department of Agronomy and Soils, Auburn University

Fall conditions in southern Alabama were generally dry and warm through harvest. However, boll rot was a serious problem at the Wiregrass Substation, Headland. At Brewton, the season was ideal and insect control was especially effective. Yield of the best variety, McNair 511, was in excess of 3 bales per acre.

The test at the Plant Breeding Unit, Tallahassee, was severely damaged by exceptionally high numbers of banded-wing whitefly, Trioleurodes abutilonea. Control efforts were largely unsuccessful.

Explanation of Data

Yield of Seed Cotton: Tests at Prattville, Tallahassee, Belle Mina, Crossville, Brewton, Monroeville, and Auburn were harvested by a mechanical spindle picker. The tests at Winfield and Headland were harvested by hand. Average weight of seed cotton per acre was determined for each variety at each location.

Lint Percentage: A sample of seed cotton of each variety from each location was taken at harvest and ginned on a 10-saw gin. Lint percentage was calculated by dividing weight of lint by weight of seed cotton.

Yield of Lint: Lint yield was determined by multiplying the lint percentage by yield of seed cotton.

Fiber Properties: Measurements of fiber properties are not available at this time. A supplement to this report will be made when this information is available.

Fusarium Wilt: Reaction of varieties to Fusarium wilt was evaluated at the Plant Breeding Unit, Tallahassee, by growing the varieties in fields with a high

natural incidence of Fusarium wilt. Results of these tests vary from year to year and also from different areas of the field in the same year. Therefore, it is necessary to have several year's data to realistically characterize a variety's wilt reaction. These data are summarized in Table 7. Auburn 56 is the only variety tested each year that has been highly resistant. Several other varieties appear to have resistance but are either inconsistent in response or have been tested for a relatively short period. These are McNair 511, Deltapine 25, Delcot 277, Stoneville 603, and Coker 310.

Stoneville 213 and Hancock have consistently shown a large incidence of wilt. Hancock was not tested in 1972; however, in 1973 and 1974 and years prior to 1972 it was extremely susceptible. All other varieties that have been tested for at least 3 years have some tolerance to Fusarium wilt. Judgment of resistance should not be made on a single year's data.

New and Experimental Varieties

Acala 1517-70 and Lockett 4789A were included in tests that were part of a national variety testing program. These are Western varieties included as uniform standards and are not adapted to our area. Coker 312 as a tight boll type developed for western conditions. It will not be offered for planting in this area and will not be included in future Alabama variety tests. Coker 8304 is an early maturity advanced line which will probably be released and available in 1976 under the name Coker 304. Deltapine 652 is to be released soon and may be available for planting in 1976. It is earlier than Deltapine 16 with a similar tolerance to Fusarium wilt. Stoneville 731N is a nectariless line which may be released but no sooner than 1976.

McNair 71317, 6x6-19B, 1x6-56, and CS28-3M2-1 are lines used in narrow row research and were included only for comparative purposes when grown with conventional culture.

Coker 1104, Coker 220, Coker 202, Coker 11067, Dixie King 135, and Stoneville 164 are advanced breeding lines which are being evaluated as potential varieties.

Acknowledgment

I wish to express my appreciation to Dr. A. J. Kappelman, Jr., for Fusarium wilt ratings, to superintendents J. K. Boseck, J. T. Eason, Robert Moore, J. G. Starling, F. T. Glaze, Emmett Carden, and J. W. Langford for growing and harvesting the variety tests, and to Research Data Analysis for assistance in summarizing the data.

Table 7. Percentage of Plants Showing Symptoms of Fusarium wilt.

Variety	1974	1973-74	1972-74	1971-74	1970-74	1969-74	1968-74	1967-74
	2-yr av.	3-yr av.	4-yr av.	5-yr av.	6-yr av.	7-yr av.	8-yr av.	
Auburn	56	32.3	24.7	23.1	27.6	24.3	23.2	20.4
Coker 201	16.7	10.5	12.4	22.3	32.4	33.4	28.6	36.9
Deltapine 16	22.0	19.4	21.5	30.6	41.3	39.5	38.4	35.9
Deltapine 45A	23.3	15.4	13.4	28.2	42.0	39.6	38.0	33.7
Stoneville 213	39.5	57.9	49.0	49.8	58.8	63.3	68.1	64.8
Coker 310	19.7	33.2	25.4	36.7	29.4	26.2		
Coker 417	24.7	30.5	30.3	35.0	37.9	40.5		
Stoneville 603	35.3	26.1	24.2	30.5	32.1	29.5		
Delcot 277	19.3	20.2	17.3	22.4	31.6			
Deltapine 25	21.3	30.7	24.9	27.0				
McNair 210	32.3	37.6	24.8	32.9				
McNair 511	27.9	28.5	24.7	27.8				
Coker 8304	33.0	31.9	30.1					
Deltapine 652	30.7	32.2	27.1					
Coker 220	9.7	28.1						
Coker 312	20.3	30.2						
Dixie King III	8.7	25.4						
Hancock	42.0	63.0						
McNair 612	27.5	40.0						
Coker 1104	15.0							
Coker 202	20.7							
Coker 11067	17.0							

1/ Data were taken from a field severely infested with the Fusarium wilt fungus and root-knot nematodes, Plant Breeding Unit, Talladega, Alabama.
